Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Cycomplex: An immunoglobulin heterotetramer subunit consists of two identical light (hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into cysuperfamily: immunoglobulin c region; immunoglobulin homology cysuperfamily: immunoglobulin c region; immunoglobulin homology cysuperfamily: immunoglobulin homology cimes: immunoglobulin homology cim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     the common ancesto

specific for a target effector site on the epsilon-heavy chain of IgE, and soo preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (1) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (1) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. NAY79994 to AAY80084 represent amino coil sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Immunoglobulin E; IgE; epsilon heavy chain; antigenic; antigen; immunoglobulin immunostimulatory; carrier protein; helper T cell epitope; antibody; allergy; allergic disease; immunisation; anti-allergic; anti-asthmatic; asthma; anaphylactic; acthmatic; asthmatic; asthmatis; dermatitis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes immunoglobulin E (IgE)-CH3 domain antignalic peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce affer (mon-anaphylactogenic) antibodies. AAY79994 to AAY80084 represent anino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Immunoglobulin E; IgE; epsilon heavy chain; antigenic; antigen; himmunoglopelic; hamunostimulatory; carrier protein; helper T cell epitope; antibody; allergy; allergic disease; immunisation; anti-allergic; anti-asthmatic; asthma; anaphylaxis; dermatitis.

The present invention describes immunoglobulin E (IgE)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and
                                                                                                                                                                                                                                                                       ö
    Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAY79994 to AAX80084 represent amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  maximize cross reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAY79994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Immunoglobulin E; IgE; epsilon heavy chain; antigenic; antigen; immunoglobulc; immunostimulatory; carrier protein; helper T cell epitope; antibody; allergy; allergy disease; immunisation; anti-allergic; anti-anaphylactic; anti-asthmatic; asthma; anaphylaxis; dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antigenic peptide from the CH3 domain of immunoglobulin E, fusions for immunization against allergy -

antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. RAY79994 to AAX80084 represent amino acid sequences used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of 1gE, and so preventing triggering and activation of mast cells and basophils and so preventing triggering and activation of mast cells and basophils and downregulation of 1gE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against 1gE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. (conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. NAY79994 to AAR80084 represent amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                        Immunoglobulin E; IgE; epsilon heavy chain; antigenic; antigen; immunograhic; immunostimulatory; carrier protein; helper T cell epitope; antibody; allergy; allergic disease; immunisation; anti-allergic; anti-asthmatic; asthma; anaphylaxis; dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antigenic peptide from the CH3 domain of immunoglobulin E, fusions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes immunoglobulin E (IgE)-CH3 domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       77.8%; Score 105; DB 21; Length 57; 72.0%; Pred. ```

NAME OF THE OF T

```
antigento peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. (conjugates of (I) that include a promiscuous T helper cell peptope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAY79994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
The present invention describes immunoglobulin E (IgE)-CH3 domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 62;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antigenic peptides (1). (1) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (1) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (1) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthmm anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (1) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAY19994 to AAX80084 represent amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The present invention describes immunoglobulin E (IgE)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal antibodies and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and soo preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAY79994 to AAX80084 represent amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Promiscuous T-cell epitope, measles virus F protein; MVF; hepatitis B virus surface antigen; HBV; immunogenic; B-cell epitope; luteinising hormone releasing hormone; LHRH; contraceptive; anticancer; somatostatin; growth promotion; CD4 receptor; HIV-1; antiviral; FMDV; foot and mouth disease virus; immunoglobulin E; IgE; anti-allergic; Plasmodium falciparum; circumsporozoite; antimalarial; CETP; cholesteryl ester transport protein; anti-arteriosclerotic.

Sequence

á qq The invention relates to novel promiscuous T helper cell epitopes (Th), and minuogenic peptides compitising the Th epitopes and peptide immunogenic containing them, are used to induce a T helper cell response, containing them, are used to induce a T helper cell response, containing them, are used to induce a T helper cell response, containing them, are used to induce a T helper cell response, specifically against Plasmodium falciparum, cholesteryl ester transport containing them, are used to induce a protein and/or transport protein immunogens may be used for prevention and/or transment of infections (HIV, foot and-mouth lidease or malaria); for cancer immunostariation); for contraception, retenant of hormone (LMRH) for contraception, retenant of a promiscous immunogean immunostariation); for prompting the protein of animals; or for treating allegies or arteriosclerosis. Incorporation of a promiscous capacity to induce a strong T helper cell-mediated immune cell mentocastration); for prompting the per cell-mediated immune cell mentocastration); for prompting the per cell-mediated immune cell mentocastration; in genetically diverse subjects) into an immunogen improves capacity to induce a strong T helper cell-mediated immune cell mentocastration; and sequences subjects) and AN91124-v91134 are participated and AN912125 and AN91125. The performance of the mentocastration in production of antiboder-derived T helper cell-mediated mentocastration and any participates based on the MAY9116-v9116, and AN9118, and AN91118, and any periode AN9118, and AN91118, and AN91118, and any periode AN9118, and AN91118, and AN911 epitope which may be used as a component in an anti-HIV-1 vaccine. AAY91198 and AAY91199 are respectively an immunostimulatory invasin protein epitope from Yersinia species, and hinge spacer peptide, both of which may optionally be used in the antigenic peptides of the invention. New artificial T helper cell epitope and derived immunogens with target antigenic site, for immunization against e.g. malaria, arteriosclerosis Example 6; Page 40; 129pp; English. antigenic site, for immunization or human immune deficiency virus (UNBI-) UNITED BIOMEDICAL INC. 99WO-US13975. 98US-0100412

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The specification describes peptide immunogens comprising a synthetic helper T cell (Th) epitope and a target antigen, luteinising hormone-releasing hormone (LHRH). The peptide immunogens cause induction of a specific immune response to LHRH which is involved in regulation of spermatogenesis, ovulation, oestrus, sexual development and secretion of sex hormones. Provision of a promiscuous T helper epitope (which is functional in genetically diverse subjects) provides optimum immunogenicity to the B cell epitopes of the target antigen and thus high antibody titres against the target antigen. The peptide immunogens of the invention are used to vaccinate against mammalian LHRH, for use as (reversible) contraceptive; control of hormone-dependent tumours (cancer of prostate or breast, also endometriosis); to prevent boar taint (and improve meat quality) and for immunocastration. The present sequence appears in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New peptide immunogen containing luteinising hormone-releasing hormone antigen site and helper {\tt T} cell epitope, for e.g. contraception and

The present invention describes immunoglobulin E (IgE)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-ashmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, acathma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and
                                                                                                                                                                                                                                              immunogenic; immunostimulatory; carrier protein; helper T cell epitope; antibody; allergy; allergic disease; immunisation; anti-allergic; anti-anaphylactic; anti-asthmatic; asthma; anaphylaxis; dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     maximize cross reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAY79994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention.

Interclude (HWY, 1007-and mouth uisease of matalal); for canterious (HWY, 1007-and mouth uisease of matalal); for cantraception, treatment of hormone releasing hormone (LHRH) for contraception, treatment of hormone—

Comproves capacity for promoting the growth of animals; or for treating allergies or arteriosclerosis. Incorporation of a promiscuous treating allergies or arteriosclerosis. Incorporation of a promiscuous of the fortional in genetically diverse subjects) into an immunogen in genetically diverse subjects) into an immunogen improves capacity to induce a strong T helper cell-mediated immune response, resulting in production of antibodies against a target on tigen. Th can replace carrier proteins and pathogen-derived T helper epitopes. Sequence AAY91121 represents a promiscuous T helper epitope from the measles virus F (MVF) protein and sequences AAY9112-Y91142, AAY9125 and AAY9124 represents a promiscuous T hepitope. Crom hepatitis B virus (HWY) surface antigen, and sequences antigenic peptides comprising an LHRH sequence joined to a promiscuous The pitope. AAY91197 is the LHRH target antigenic peptide used in these LHRH antigenic peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       peptides comprising sometostatin and a Th epitope. Sometostatin jimmunogens may be used to promote growth in livestock. AAY91208 is a man of CDR2-like domain antigenic site, and AAY91209-Y90211 are MVH Th epitope/CD4 CDR2 attigenic peptides which may be used to prevent HIV infection of T cells. AAY90215 is a modified version of a human IgE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (immunoglobulin E) CH3 domain, and AAY90213-Y90219 are Th epitope/IgE CH3 antigenic peptides which may be used in the treatment of allergies. AAY91220 is a peptide derived from foot and mouth disease virus (FMDV) VPI capsid protein and AAY91221-Y91222 comprise this peptide and a Th
The invention relates to novel promiscuous T helper cell epitopes (Th), and immunogenic peptides comprising the Th epitopes of the invention along with B cell epitopes. The Th epitopes and peptide immunogens containing them, are used to induce a T helper cell response, specifically against Plasmodium falciparum, cholesteryl ester transport protein (CETP) or HIV epitopes, but more generally against any pathogen, immunoreactive self-antigen or tumour antigen. The Th epitopes and peptide immunogens may be used for prevention and/or treatment of infections (HIV, foot-and-mouth disease or malaria); for cancer

epitope. AAY91223 is a Plasmodium falciparum circumsporozoite (CS) target antigen, and AAY91224-Y91225 comprise the CS antigen and an WNF The epitope and may be used in a malaria vaccine. AAY91228-Y91231 represent CETP-derived peptides and AAY91232-Y91241 are immunogens comprising a CETP peptide and a Th epitope which may be used to prevent or treat are teriosclerosis and cardiovascular disease. AAY91248-Y91251 and AAY91258-Y91273 are antigenic peptides comprising MNH Th and HIV-1 B-cell epitope which may be used as a component in an anti-HIV-1 vaccine. AAY91199 are respectively an immunostimulatory invasin protein epitope from Yersinia species, and hinge spacer peptide, both of which may optionally be used in the antigenic peptides of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to novel promiscuous T helper cell epitopes (Th), and immunogenic peptides comprising the Th epitopes of the invention *along with B cell epitopes. The Th epitopes and peptide immunogens containing them, are used to induce a helper cell response, specifically against Plasmodium falciparum, cholesteryl ester transport protein (CETP) or HIV epitopes, but more generally against any pathogen,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Promiscuous T-cell epitope; measles virus F protein; MVF; hepatitis B virus surface antigon; HBV; immunogenic; B-cell epitope; luteinising hormone releasing hormone; LHRH; contraceptive; anticancer; somatostatin; growth promotion; CD4 receptor; HIV-1; antiviral; FMDV; foot and mouth disease virus; immunoglobulin E; IgE; anti-allergic; eholesteryl ester transport protein; anti-antivicit; corpside the protein; anti-antivicit; corpside the protein; anti-antivicit; corpside the protein; anti-antivicities of the protein; anti-antivicities of the protein anti-antivicities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New artificial T helper cell epitope and derived immunogens with target antigenic site, for immunization against e.g. malaria, arteriosclerosis or human immune deficiency virus
                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

immunoreactive self-antigen or tumour antigen. The Th epitopes and peptide immunoreactive self-antigen or tumour antigen. The action of luteinising hormone clause and be used for prevention treatment of infections (HIV, foot-and-mouth disease or malaria); for cancer immunotherapy; for inhibition of the action of luteinising hormone classing hormone (HIRH) for contraception, treatment of hormone-dependent cancer, prevention of boar taint in meat, and dependent cancer, prevention of boar taint in meat, and dependent cancer, prevention of boar taint in meat, and immunosatration); for promoting the growth of animals; or for for treating allergies or arteriosclerosis. Incorporation of a promiscuous Th (functional in genetically diverse subjects) into an immunogen improves capacity to induce a strong Thelper cell-mediaced immune response, resulting in production of antibodies against a target antigen. The an replace carrier proteins and pathogen-destried Thelper coll mediaced immune tresponse, resulting in production of antibodies against a target antigen. The nar replace carrier proteins and pathogen-destried Thelper coll mediaced immune tresponse, resulting in production of antibodies against a target antigen. The protein and avayllate (HWF) surface antigen, and sequences avayllate (HWF) surface antigen, and sequences avayllated version and avayllated and avayllated and avayllated and antigenic peptides comprising an LiHR sequence joined to a promiscuous Theptope. Avayllated carrier and pathogens and pathogens and avayllated version of a man antigenic peptides antigenic peptides which may be used to prevent HIV immunogens may be used to promote growth in liveston, and avayllated version of a mediace and avayllated version of a mediace for immunogens may be used in a malaria vaccine. Avayllate and an antigenic peptides which may be used in the treatment of allergies of immunogens man and avayllated fervived from foot and mouth disease virus (FWPV) vpl capsid protein and Avayllate fervived from foot and mouth disease

cholesteryl ester transport protein; anti-arteriosclerotic.

Chimeric - Measles virus. Chimeric - Homo sapiens.

99WO-US13975. 98US-0100412 (UNBI-) UNITED BIOMEDICAL INC

WPI; 2000-160564/14.

New artificial T helper cell epitope and derived immunogens with target antigenic site, for immunization against e.g. malaria, arteriosclerosis or human immune deficiency virus

The invention relates to novel promiscuous T helper cell epitopes (Th), and immunogenic peptides comprising the The pitopes of the invention along with B cell epitopes. The The pitopes and peptide immunogens containing them, are used to induce a T helper cell response.

Containing them, are used to induce a T helper cell response.

Containing them, are used to induce a T helper cell response.

Specifically against Plasmodium falciparum, cholesteryl ester transport protein (CETP) or HIV epitopes, but more generally against any pathogen, mannorcherapy; for inhibition of the action of luteinising hormone classing hormone (LIRH) for contraception, treatment of hormone-classing hormone (LIRH) for promoting the growth of animals; or for treating allergies or arteriosclerosis. Incorporation of a promiscuous in (Innuctional In genetically diverse subjects) into an immunocation of mingroves capacity to induce a strong T helper cell-mediated immune response, resulting in production of antibodies against a target ceptiopes. Sequence AAY9112 represents a promiscuous T helper ceptiope.

Comprises capacity to induce a strong T helper cell-mediated immune response, resulting in production of antibodies against a target of the personse. resulting in production of antibodies against a target ceptiopes. Sequence AAY9112 represents a promiscuous Thelper ceptiope.

Comprises Sequence AAY9112 represents a promiscuous Theptope.

Comprises and AAY9124-Y9136 represents a promiscuous The pitope.

AAY91126 and AAY9127 and AAY91201 represents a promiscuous The pitope.

Comprising an LiMH sequence Johned to a promiscuous The pitope.

AAY91144-Y91155 are synthetic epitopes derived from this Hay to a peptides and yay91201 septide used to the pitope.

Comprising an LiMH sequence of other any per used to prevent HIV infection of T cells. AAY91201 seminor are HIV-1 neutralising B-cell epitopes, and AAY91248-Y91251 and AAX91258-Y91253 are antigenic peptides comprising MVH Th and HIV-1 B-cell epitope which may be used as a component in an anti-HIV-1 vaccine.
AAY91198 and AAY91199 are respectively an immunostimulatory invasin protein epitope from Yersinia species, and hinge spacer peptide, both of Example 6; Page 99; 129pp; English.
